BOOT0

NRST is pulled up to VDD
It can be used to drive BOOT0 HIGH
to enter bootloader mode

RevC1: BOOT0 is not on the expansion header
you need to solder a patch wire to the
tactile switch on board

Luckily we can solder on the board edge side.
It's the left leg when looking from the edge.

See http://bit.ly/1dblugA

RevC2: See http://bit.ly/OtoQXh for pinout.
